

BUDENBERG TECHNICAL SERVICES

Budenberg Technical Services is able to provide recalibration and Repair services to customers - globally. In the UK, we have specialised engineers, able to receive, evaluate and repair instruments that we receive from our customers and we follow stringent safety procedures to ensure that any process media residue is handled in accordance with COSHH regulations.

In addition to our in-house capability, we also offer an on-site calibration service to our customers. This can be extended to a full site survey of existing equipment, whether this is for in-situ components or stored stock.

Procedures Review

Often, we are able to offer assistance to our customers by reviewing their current procedures for testing complex gauge assemblies. It may be the case that a system of testing differential gauges, for example, may show errors - due to the test equipment being utilised. Our engineers would be pleased to visit your site and conduct detailed training based upon the production testing processes that are used by Budenberg.

Site Surveys

These are useful exercises for organisations that utilise many site instruments.

Budenberg engineers will carry out a detailed site survey of all instrument stock and produce a status report with recommendations such as:

Recalibrate

Repair

Replace

In some instances, we have recommended different equipment for certain processes in an effort to reduce long term issues or to reduce the cost of ownership.

On Site Calibration

Store Surveys

Some customers keep long-term instrument stock that goes beyond shelf life. It may also be the case that a spares item has been superseded and a more efficient design has taken its place.

A stores survey by a member of the Budenberg team is the best way to identify the items that require action such as replacement or repair.

As part of the service a direct equivalent for existing stock can be offered to provide a one-stop-shop for future needs and, in most cases, significant cost reductions.

For full details of the service that Budenberg is able to offer, please contact a member of our internal sales team.
